

ABSTRACT OF THE DISCLOSURE

An offset socket drive has a body member with a drive gear that receives the drive head of an impact socket and a driven gear, gearably connected with the drive gear. The driven gear
5 has a hollow core and receives that socket, which socket also has a hollow core that longitudinally aligns with the driven gear's hollow core. The socket may be directly received within the driven gear or may be received by a hex-to-square adapter or an extension system, each such additional devices also having a
10 hollow core that longitudinally aligns with the driven gear's hollow core. A handle is removably and threadably attached to a desired position on the body member.
